

2Gb DDR3/DDR3L SDRAM Specification

Specifications

- Density: 2G bits
- Organization
 - 8 banks x 32M words x 8 bits 0
 - 8 banks x 16M words x 16 bits 0
- Package
 - 78-ball FBGA 0
 - 96-ball FBGA 0
 - Lead-free(RoHS compliant) and Halogen-free 0
- Power supply:
- -HP
 - VDD, VDDQ = 1.35 V (1.283 to 1.45 V) 0
 - Backward compatible with DDR3 operation 0 VDD, VDDQ = 1.5 V (1.425 to 1.575 V)
 - -IR
 - VDD, VDDQ = 1.5 V (1.425 to 1.575 V) 0 -JRL
 - VDD, VDDQ = 1.35 V (1.283 to 1.45 V) 0
- Data Rate: 1866 Mbps /2133 Mbps (max.)
- 1KB page size (x8)
 - Row address: AX0 to AX14 0
 - Column address: AYO to AY9 0
- 2KB page size (x16)
 - Row address: AX0 to AX13 0
 - Column address: AY0 to AY9 0
- Eight internal banks for concurrent operation
- Burst lengths(BL): 8 and 4 with Burst Chop(BC)
- Burst type(BT)
 - Sequential (8, 4 with BC) 0
 - Interleave (8, 4 with BC) 0
- CAS Latency (CL): 5, 6, 7, 8, 9, 10, 11, 13, 14
- CAS Write Latency (CWL): 5, 6, 7, 8, 9, 10
- Precharge: auto precharge option for each burst access
- Driver strength: RZQ/7, RZQ/6 (RZQ = 240 Ω)
- Refresh: auto-refresh, self-refresh
- Average refresh period
 - \circ 7.8 us at TC \leq +85°C
 - 3.9 us at TC > +85°C 0
- Operating temperature range
 - TC = 0°C to +95°C (Commercial grade)
 - TC = -40°C to +95°C (Industrial grade) 0
 - TC = -40°C to +105°C (Automotive grade 2) 0

Features

- The high-speed data transfer is realized by the 8 bits prefetch pipelined architecture
- Double data-rate architecture: two data transfers per clock cycle
- Bi-directional differential data strobe (DQS and /DQS) is transmitted/received with data for capturing data at the receiver
- DQS is edge-aligned with data for READs; center aligned with data for WRITEs
- Differential clock inputs (CK and /CK)
- DLL aligns DQ and DQS transitions with CK transitions
- Commands entered on each positive CK edge; data and data mask referenced to both edges of DQS
- Data mask (DM) for write data
- Posted CAS by programmable additive latency for better command and data bus efficiency
- On-Die Termination (ODT) for better signal quality Synchronous ODT 0
 - 0 Dynamic ODT
 - Asynchronous ODT 0
- Multi Purpose Register (MPR) for pre-defined pattern read out
- ZQ calibration for DQ drive and ODT
- Programmable Partial Array Self-Refresh (PASR)
- RESET pin for Power-up sequence and reset function
- SRT(Self Refresh Temperature) range:
- Normal/Extended 0
- Auto Self-Refresh (ASR)
- Programmable output driver impedance control
- JEDEC compliant DDR3/DDR3L
- Row-Hammer-Free (RH-Free): detection/blocking circuit inside

Key Timing Parameters

| Speed Grade | Data Rate(Mbps) | CL | nRCD | nRP |
|------------------------|-----------------|----|------|-----|
| -JR ^{1, 2, 3} | 2133 | 14 | 14 | 14 |
| -HP ^{1, 2} | 1866 | 13 | 13 | 13 |

Notes: 1. Backward compatible to 1333, CL-nRCD-nRP = 9-9-9

- 2. Backward compatible to 1600, CL-nRCD-nRP = 11-11-11
- 3. Backward compatible to 1866, CL-nRCD-nRP = 13-13-13

Table of Contents

| Pin name | Function | Pin name | Function |
|--------------------------------|----------------------------------|-------------------------------|-------------------------------------|
| A0 to A14 (x8) ^{*3} | Address inputs | СК, /СК | Differential clock input |
| | A10(AP):Auto precharge | /CS *3 | Chip select |
| A0 to A13 (x16) ^{*3} | A12(/BC):Burst chop | /RAS, /CAS, /WE ^{*3} | Command input |
| BAO to BA2 ^{*3} | Bank select | CKE *3 | Clock enable |
| DQ0 to DQ7 (x8) | Data input/output | ODT ^{*3} | ODT control |
| DQ0 to DQ15 (x16) | | VDD | Supply voltage for internal circuit |
| DQS, /DQS (x8) | Differential data strobe | VSS | Ground for internal circuit |
| DQSU, /DQSU, DQSL, /DQSL (x16) | Differential data strobe | VDDQ | Supply voltage for DQ circuit |
| DM (x8) | Write data mask | VSSQ | Ground for DQ circuit |
| DMU, DML (x16) | White data mask | VREFDQ | Reference voltage for DQ |
| TDQS, /TDQS (x8) | Termination data strobe | VREFCA | Reference voltage for CA |
| /RESET ^{*3} | Active low asynchronous reset | NC ^{*1} | No connection |
| ZQ | Reference pin for ZQ calibration | NU ^{*2} | Not Usable |

Notes:

1. Not internally connected with die

2. Don't connect. Internally connected

3. Input only pins (address, command, CKE, ODT and /RESET) do not supply termination

3. Package outline drawing

4. Electrical Specifications

All voltages are referenced to each VSS (GND)

Execute power-up and Initialization sequence before proper device operation can be achieved.

4.1 Absolute Maximum Ratings

| Parameter | Symbol | Rating | Unit | Notes |
|---------------------------------|--------|--------------------|------|-------|
| Power supply voltage | VDD | -0.4 to +1.975 | V | 1, 3 |
| Power supply voltage for output | VDDQ | -0.4 to +1.975 | V | 1, 3 |
| Input voltage | VIN | -0.4 to +1.975 | V | 1 |
| Output voltage | VOUT | -0.4 to +1.975 | V | 1 |
| Reference voltage | VREFCA | -0.4 to 0.6 x VDD | V | 3 |
| Reference voltage for DQ | VREFDQ | -0.4 to 0.6 x VDDQ | V | 3 |
| Storage temperature | Tstg | -55 to +150 | °C | 1, 2 |
| Power dissipation | PD | 1.0 | W | 1 |
| Short circuit output current | IOUT | 50 | mA | 1 |

Notes:

- 1. Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability
- 2. Storage temperature is the case surface temperature on the center/top side of the DRAM.
- 3. VDD and VDDQ must be within 300mV of each other at all times; and VREF must be not greater than 0.6 x VDDQ, When VDD and VDDQ are less than 500mV; VREF may be equal to or less than 300mV

Caution:

Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

4.2 Operating Temperature Condition

| Product grades | Parameter | Symbol | Rating | Unit | Note |
|--------------------|----------------------------|--------|-------------|------|---------|
| Commercial | | | 0 to +95 | | |
| Industrial | Operating case temperature | TC | -40 to +95 | °C | 1, 2, 3 |
| Automotive grade 2 |] | | -40 to +105 | | |

Notes:

- 1. Operating temperature is the case surface temperature on the center/top side of the DRAM.
- The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0°C to +85°C under all operating conditions.
- 3. Some applications require operation of the DRAM in the Extended Temperature Range between +85°C and +95°C (and +105°C for automotive grade only) case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
 - Refresh commands must be doubled in frequency, therefore reducing the refresh interval tREFI to 3.9µs
 - If Self-refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 bit [A6, A7] = [0, 1]) or enable the optional Auto Self-Refresh mode (MR2 bit [A6, A7] = [1, 0]).

4.3 Recommended DC Operating Conditions

4.3.1 <u>Recommended DC operating Conditions for DDR3L (1.35V)</u>

| Parameter | Symbol | min. | typ. | max. | Unit | Note |
|-----------------------|--------|-------|------|------|------|------|
| Supply voltage | VDD | 1.283 | 1.35 | 1.45 | V | 1, 2 |
| Supply voltage for DQ | VDDQ | 1.283 | 1.35 | 1.45 | V | 1, 2 |

Notes:

1. Maximum DC value may not be greater than 1.425V. The DC value is the linear average of VDD/VDDQ(t) over a very long period of time (e.g. 1sec.)

2. If maximum limit is exceeded, input levels shall be governed by DDR3 specifications; Under these supply voltages, the device operates to this DDR3L specification; Once initialized for DDR3L operation, DDR3 operation may only be used if the device is in reset while VDD and VDDQ are changed for DDR3 operation shown as following timing waveform

4.3.2 <u>Recommended DC operating Conditions for DDR3 (1.5V)</u>

| Parameter | Symbol | min. | typ. | max. | Unit | Note |
|-----------------------|--------|-------|------|-------|------|------|
| Supply voltage | VDD | 1.425 | 1.5 | 1.575 | V | 1, 2 |
| Supply voltage for DQ | VDDQ | 1.425 | 1.5 | 1.575 | V | 1, 2 |

Notes:

- 1. If minimum limit is exceeded, input levels shall be governed by DDR3L specifications
- 2. Under 1.5V operation, the DDR3L device operates to the DDR3 specification under the same speed timings as defined for this device; Once initialized for DDR3 operation, DDR3L operation may only be used if the device in reset while VDD and VDDQ are changed for DDR3L operation shown as below

Note : From time point Td until Tk, NOP or DES commands must be applied between MRS and ZQCL commands

For DDR3 operation

4.4 AC and DC Input Measurement Levels [Refer to section 8 in JEDEC Standard No. JESD79-3F] 4.5 AC and DC Output Measurement Levels [Refer to section 9 in JEDEC Standard No. JESD79-3F] 4.6 Address / Command Setup, Hold and Derating [Refer to section 13.5 in JEDEC Standard No. JESD79-3F] 4.7 **Overshoot and Undershoot Specifications** [Refer to section 9.6 in JEDEC Standard No. JESD79-3F] 4.8 **Output Driver DC Electrical Characteristics** [Refer to section 9.7 in JEDEC Standard No. JESD79-3F] **On-Die Termination (ODT) Levels and I-V Characteristics** 4.9 [Refer to section 9.8 in JEDEC Standard No. JESD79-3F] For DDR3L operation 4.10 1.35 V DDR3L AC and DC Logic Input Levels for Single-Ended Signals [Refer to section 3 in JEDEC Standard No. JESD79-3-1A.01] 4.11 1.35 V DDR3L Electrical Characteristics and AC Timing [Refer to section 4 in JEDEC Standard No. JESD79-3-1A.01] Address / Command Setup, Hold and Derating 4.12 [Refer to section 4.1 in JEDEC Standard No. JESD79-3-1A.01] 4.13 Data Setup, Hold and Slew Rate Derating [Refer to section 4.2 in JEDEC Standard No. JESD79-3-1A.01] **Overshoot and Undershoot Specifications** 4.14 [Refer to section 9.6 in JEDEC Standard No. JESD79-3F] 1.35V DDR3L Output Driver DC Electrical Characteristics 4.15 [Refer to section 6 in JEDEC Standard No. JESD79-3-1A.01] 1.35V DDR3L On-Die Termination (ODT) Levels and I-V Characteristics 4.16 [Refer to section 7 in JEDEC Standard No. JESD79-3-1A.01] 1.35 V DDR3L Single Ended Output Slew Rate 4.17 [Refer to section 8 in JEDEC Standard No. JESD79-3-1A.01] 4.18 1.35 V Differential Output Slew Rate [Refer to section 9 in JEDEC Standard No. JESD79-3-1A.01]

4.19 1.35 V DDR3L AC and DC Logic Input Levels for Differential Signals [Refer to section 10 in JEDEC Standard No. JESD79-3-1A.01]

4.20 Differential Input Cross point voltage [Refer to section 11 in JEDEC Standard No. JESD79-3-1A.01]

4.21 DQS Output Cross point voltage

[Refer to section 12 in JEDEC Standard No. JESD79-3-1A.01]

4.23 Self-Refresh Current

| Parameter | Symbol | x8 (1.35V) | x8 (1.5V) | x16 (1.35V) | x16 (1.5V) | Unit | Notes |
|--|--------|------------|-----------|-------------|------------|------|-------|
| Falameter | Symbol | max. | max. | max. | max. | onit | Notes |
| Self-refresh current Normal temperature range | IDD6 | 10 | 10 | 10 | 10 | mA | |
| Self-refresh current Extended temperature range | IDD6ET | 14 | 14 | 14 | 14 | mA | |

Notes for DC Characteristics and Self-Refresh Current:

- Enabling ASR could increase IDDx by up to an additional 2mA.
- The IDD values must be derated (increased) on Industrial and Automotive grade devices when operated outside of the range 0°C ≤ TC ≤ +85°C:
 - i. When TC < 0°C: IDD2P0, IDD2P1 and IDD3P must be derated by 4%; IDD4R and IDD4W must be derated by 2%; and IDD6, IDD6ET and IDD7 must be derated by 7%.
 - ii. When TC > 85°C: IDD0, IDD1, IDD2N, IDD2NT, IDD2Q, IDD3N, IDD3P, IDD4R, IDD4W, and IDD5B must be derated by 2%; IDD2Px must be derated by 30%.
- For Automotive grade products, when TC > 95°C, all IDD excepting IDD6 must be increased by 20%

[Refer to section 10 in JEDEC Standard No. JESD79-3F for detailed test condition]

Note:

• For devices supporting optional down binning to CL=7 and CL=9, tAA/tRCD/tRPmin must be 13.125 ns. SPD settings must be programmed to match. For example, DDR3-1333 devices supporting down binning to DDR3-1066 should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1600 devices supporting down binning to DDR3-1333 or DDR3-1066 should program 13.125 ns in SPD bytes for tAAmin (Byte16), tRCDmin (Byte 18), and tRPmin (Byte 20). Once tRP (Byte 20) is programmed to 13.125ns, tRCmin (Byte 21,23) also should be programmed accordingly. For example, 49.125ns (tRASmin + tRPmin = 36 ns + 13.125 ns) for DDR3-1333 and 48.125ns (tRASmin + tRPmin = 35 ns + 13.125 ns) for DDR3-1600. [Refer to section 12.3 in JEDEC Standard No. JESD79-3F]

[Refer to section 13 in JEDEC Standard No. JESD79-3F]

5. Block Diagram

6. Pin Function

CK, /CK (input pins)

CK and /CK are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of /CK. Output (read) data is referenced to the crossings of CK and /CK (both directions of crossing).

/CS (input pin)

All commands are masked when /CS is registered high. /CS provides for external rank selection on systems with multiple ranks. /CS is considered part of the command code.

/RAS, /CAS, /WE (input pins)

/RAS, /CAS and /WE (along with /CS) define the command being entered.

A0 to A14 (input pins)

Provided the row address for active commands and the column address for read/write commands to select one location out of the memory array in the respective bank. (A10(AP) and A12(/BC) have additional functions, see below) The address inputs also provide the op-code during mode register set commands.

[Address Pins Table]

| Configuration | Page Size | Address (/ | A0 to A14) |
|---------------|-----------|-------------|----------------|
| configuration | Fage Size | Row address | Column address |
| x8 | 1KB | AX0 to AX14 | AY0 to AY9 |
| x16 | 2KB | AX0 to AX13 | AY0 to AY9 |

A10(AP) (input pin)

A10 is sampled during read/write commands to determine whether auto precharge should be performed to the accessed bank after the read/write operation. (high: auto precharge; low: no auto precharge) A10 is sampled during a precharge command to determine whether the precharge applies to one bank (A10 = low) or all banks (A10 = high). If only one bank is to be precharged, the bank is selected by bank addresses (BA).

A12(/BC) (input pin)

A12 is sampled during read and write commands to determine if burst chop (on-the-fly) will be performed. (A12 = high: no burst chop, A12 = low: burst chopped.) See command truth table for details.

BA0 to BA2 (input pins)

BAO, BA1 and BA2 define to which bank an active, read, write or precharge command is being applied. BAO and BA1 also determine which mode register (MRO to MR3) is to be accessed during a MRS cycle.

| Bank6 | Н | Н | L |
| Bank7 | Н | Н | Н |

Remark: H: VIH, L: VIL

CKE (input pin)

CKE high activates, and CKE low deactivates, internal clock signals and device input buffers and output drivers. Taking CKE low provides precharge power-down and self-refresh operation (all banks idle), or active power-down (row active in any bank). CKE is asynchronous for self-refresh exit. After VREF has become stable during the power-on and initialization sequence, it must be maintained for proper operation of the CKE receiver. For properself-refreshentry andexit, VREF must be maintained to this input. CKE must be maintained high throughout read and write accesses. Input buffers, excluding CK, /CK, ODT and CKE are disabled during power-down. Input buffers, excluding CKE, are disabled during self-refresh.

DM, DMU, DML (input pins)

DM is an input mask signal for write data. Input data is masked when DM is sampled high coincident with that input data during a write access. DM is sampled on both edges of DQS.

DQ0 to DQ15 (input/output pins)

Bi-directional data bus.

DQS, /DQS, DQSU, /DQSU, DQSL, /DQSL (input/output pins)

Output with read data, input with write data. Edge-aligned with read data, center-aligned with write data. The data strobe DQS is paired with differential signal /DQS to provide differential pair signaling to the system during READs and WRITES.

/RESET (input pin)

/RESET is a CMOS rail to rail signal with DC high and low at 80% and 20% of VDD (1.20V for DC high and 0.30V for DC low). It is negative active signal (active low) and is referred to GND. There is no termination required on this signal. It will be heavily loaded across multiple chips. /RESET is destructive to data contents.

ODT (input pin)

ODT (registered high) enables termination resistance internal to the DDR3 SDRAM. When enabled, ODT is applied to each DQ, DQSU, /DQSU, DQSL, /DQSL, DMU, and DML signal. The ODT pin will be ignored if the mode register (MR1) is programmed to disable ODT.

ZQ (supply)

Reference pin for ZQ calibration.

VDD, VSS, VDDQ, VSSQ (power supply pins)

VDD and VSS are power supply pins for internal circuits. VDDQ and VSSQ are power supplypins for the output buffers.

VREFCA, VREFDQ (power supply pins)

Reference voltage

7. Command Operation

7.1 Command Truth Table

The DDR3 SDRAM recognizes the following commands specified by the /CS, /RAS, /CAS, /WE and address pins.

| Function | Symbol | | KE | /CS | /RAS | /CAS | /WE | BA0-2 | A12(/BS) | A10(AP) | A0-A14 | Note |
|--|--------|---------|---------|-----|--------|------|-----|--------|-----------|-------------|----------|----------|
| runction | Symbol | Previou | Current | 700 | /10/05 | 7070 | , | 5/10/2 | /(12(/03) | /(10(/ (/) | //0 //14 | Note |
| Mode register set | MRS | Н | Н | L | L | L | L | BA | | op-code | | |
| Auto refresh | REF | н | Н | L | L | L | Н | V | V | V | V | |
| Self refresh entry | SELF | н | L | L | L | L | Н | V | V | V | V | 6, 8, 11 |

Remark:

1. H = VIH; L = VIL; V =VIH or VIL(defined logical level).

2. X = Don't care (defined or undefined, including floating around VREF) logical level.

3. BA = Bank Address. RA = Row Address. CA = Column Address. /BC = Bust Chop.

Notes:

- 1. All DDR3 commands are defined by states of /CS, /RAS, /CAS, /WE and CKE at the rising edge of the clock. The most significant bit (MSB) of BA, RA, and CA are device density and configuration dependent.
- 2. /RESET is an active low asynchronous signal that must be driven high during normal operation
- 3. Bank Addresses (BA) determines which bank is to be operated upon. For MRS, BA selects a mode register.
- 4. Burst READs or WRITEs cannot be terminated or interrupted and fixed/on the flyBL will be defined by MRS.
- 5. The power-down mode does not perform any refresh operations.
- 6. The state of ODT does not affect the states described in this table. The ODT function is not available during self-refresh.
- 7. Self-refresh exit is asynchronous.
- 8. VREF (both VREFDQ and VREFCA) must be maintained during self-refresh operation. VREFDQ supply may be turned off and VREFDQ may take any value between VSS and VDD during self-refresh operation, provided that VREFDQ is valid and stable prior to CKE going back high and that first write operation or first write leveling activity may not occur earlier than 512 nCK after exit from self-refresh.
- 9. The No Operation command (NOP) should be used in cases when the DDR3 SDRAM is in an idle or a wait state. The purpose of the NOP command is to prevent the DDR3 SDRAM from registering any unwanted commands between operations. A NOP command will not terminate a previous operation that is still executing, such as a burst read or write cycle.
- 10. The DESL command performs the same function as a NOP command.
- 11. Refer to the CKE Truth Table for more detail with CKE transition.
- 12. No more than 4 banks may be activated in a rolling tFAW window. Converting to clocks is done by dividing tFAW (ns) by tCK (ns) and rounding up to next integer value. As an example of the rolling window, if (tFAW/tCK) rounds up to 10 clocks, and an activate command is issued in clock N, no more than three further activate commands may be issued in clock N+1 through N+9.

7.2 No Operation Command [NOP]

The No Operation command (NOP) should be used in cases when the DDR3 SDRAM is in an idle or a wait state. The purpose of the NOP command is to prevent the DDR3 SDRAM from registering any unwanted commands between operations. A NOP command will not terminate a previous operation that is still executing, such as a burst read or write cycle.

The no operation (NOP) command is used to instruct the selected DDR3 SDRAM to perform a NOP (/CS low, /RAS, /CAS, /WE high). This prevents unwanted commands from being registered during idle or wait states. Operations already in progress are not affected.

7.3 Device Deselect Command [DESL]

The deselect function (/CS high) prevents new commands from being executed by the DDR3 SDRAM. The DDR3 SDRAM is effectively deselected. Operations already in progress are not affected.

7.4 Mode Register Set Command [MR0 to MR3]

The mode registers are loaded via row address inputs. See mode register descriptions in the Programming the mode register section. The mode register set command can only be issued when all banks are idle, and a subsequent executable command cannot be issued until tMRD is met.

7.5 Bank Activate Command [ACT]

This command is used to open (or activate) a row in a particular bank for a subsequent access. The values on the BA inputs select the bank, and the address provided on row address inputs selects the row. This row remains active (or open) for accesses until a precharge command is issued to that bank. A precharge command must be issued before opening a different row in the same bank.

Note: No more than 4 banks may be activated in a rolling tFAW window. Converting to clocks is done by dividing tFAW (ns) by tCK (ns) and rounding up to next integer value. As an example of the rolling window, if (tFAW/tCK) rounds up to 10 clocks, and an activate command is issued in clock N, no more than three further activate commands may be issued in clock N+1 through N+9.

7.6 Read Command [READ, RDS4, RDS8, READA, RDAS4, RDAS8]

The read command is used to initiate a burst read access to an active row. The values on the BA inputs select the bank, and the address provided on column address inputs selects the starting column location. The value on input A10 determines whether or not auto precharge is used. If auto precharge is selected, the row being accessed will be precharged at the end of theread burst; if auto precharge is not selected, the row will remain open for subsequent accesses.

7.7 Write Command [WRIT, WRS4, WRS8, WRITA, WRAS4, WRAS8]

The write command is used to initiate a burst write access to an active row. The values on the BA inputs select the bank, and the address provided on column address inputs selects the starting column location. The value on input A10 determines whether or not auto precharge is used. If auto precharge is selected, the row being accessed will be precharged at the end of the write burst; if auto precharge is not selected, the row will remain open for subsequent accesses. Input data appearing on the DQ is written to the memory array subject to the DM input logic level appearing coincident with the data. If a given DM signal is registered low, the corresponding data will be written to memory; if the DM signal is registered high, the corresponding data inputs will be ignored, and a write will not be executed to that byte/column location.

7.8 Precharge Command [PRE, PALL]

The precharge command is used to deactivate the open row in a particular bank or the open row in all banks. The bank(s) will be available for a subsequent row access a specified time (tRP) after the precharge command is issued. Input A10 determines whether one or all banks are to be precharged, and in the case where only one bank is to be precharged, inputs BA select the bank. Otherwise BA are treated as "Don't Care." Once a bank has been precharged, it is in the idle state and must be activated prior to any read or write commands being issued to that bank. A precharge command will be treated as a NOP if there is no open row in that bank (idle state), or if the previously open row is already in the process of precharging.

7.9 Auto precharge Command [READA, WRITA]

Before a new row in an active bank can be opened, the active bank must be precharged using either the precharge command or the auto precharge function. When a read or a write command is given to the DDR3 SDRAM, the /CAS timing accepts one extra address, column address A10, to allow the active bank to automatically begin precharge at the earliest possible moment during the burst read or write cycle. If A10 is low when the read or write command is issued, then normal read or write burst operation is executed and the bank remains active at the completion of the burst sequence. If A10 is high when the read or write command is issued, then the auto precharge function is engaged. During auto precharge, a read command will execute as normal with the exception that the active bank will begin to precharge on the rising edge which is (AL* + tRTP) cycles later from the read with auto precharge command.

Auto precharge can also be implemented during write commands. The precharge operation engaged by the Auto precharge command will not begin until the last data of the burst write sequence is properly stored in the memory array.

This feature allows the precharge operation to be partially or completely hidden during burst read cycles (dependent upon /CAS latency) thus improving system performance for random data access. The tRAS lockout circuit internally delays the Precharge operation until the array restore operation has been completed so that the auto precharge command may be issued with any read or write command.

Note: AL (Additive Latency), refer to Posted /CAS description in the Register Definition section.

7.10 Auto-Refresh Command [REF]

Auto-refresh is used during normal operation of the DDR3 SDRAM and is analogous to /CAS-before-/RAS (CBR) refresh in FPM/EDO DRAM. This command is nonpersistent, so it must be issued each time a refresh is required. The addressing is generated by the internal refresh controller. This makes the address bits a "Don't Care" during an auto-refresh command.

A maximum of eight auto-refresh commands can be posted to any given DDR3, meaning that the maximum absolute interval between any auto-refresh command and the next auto-refresh command is 9 x tREFI. This maximum absolute interval is to allow DDR3 output drivers and internal terminators to automatically recalibrate compensating for voltage and temperature changes.

7.11 Self-Refresh Command [SELF]

The self-refresh command can be used to retain data in the DDR3, even if the rest of the system is powered down. When in the self-refresh mode, the DDR3 retains data without external clocking. The self-refresh command is initiated like an auto-refresh command except CKE is disabled (low). The DLL is automatically disabled upon entering self-refresh and is automatically enabled and reset upon exiting self-refresh. The active termination is also disabled upon entering self-refresh and enabled upon exiting self-refresh. (512 clock cycles must then occur before a read command can be issued). Input signals except CKE are "Don't Care" during self-refresh. The procedure for exiting self-refresh requires a

sequence of commands. First, CK and /CK must be stable prior to CKE going back high. Once CKE is high, the DDR3 must have NOP commands issued for tXSDLL because time is required for the completion of any internal refresh in progress. A simple algorithm for meeting both refresh, DLL requirements and out-put calibration is to apply NOPs for 512 clock cycles before applying any other command to allow the DLL to lock and the output drivers to recalibrate.

7.12 ZQ calibration Command [ZQCL, ZQCS]

ZQ calibration command (short or long) is used to calibrate DRAM RON and ODT values over PVT. ZQ Calibration Long (ZQCL) command is used to perform the initial calibration during power-up initialization sequence. ZQ Calibration Short (ZQCS) command is used to perform periodic calibrations to account for VT variations. All banks must be precharged and tRP met before ZQCL or ZQCS commands are issued by the controller.

ZQ calibration commands can also be issued in parallel to DLL lock time when coming out of self-refresh.

7.13 CKE Truth Table

[Refer to section 4.2 in JEDEC Standard No. JESD79-3F]

8. Functional Description

8.1 Simplified State Diagram

8.2 **RESET and Initialization Procedure**

8.2.1 <u>Power-Up and Initialization Sequence</u>

- 1. Apply power
 - /RESET is recommended to be maintained below 0.2 x VDD, all other inputs may be undefined.
 - /RESET needs to be maintained for minimum 200us with stable power. CKE is pulled low anytime before /RESET being de-asserted (min. time 10ns). The power voltage ramp time between 300mV to VDD (min.) must be no greater than 200ms; and during the ramp, VDD > VDDQ and (VDD -VDDQ) < 0.3V.
 - VDD and VDDQ are driven from a single power converter output
 - AND
 - The voltage levels on all pins other than VDD, VDDQ, VSS, VSSQ must be less than or equal to VDDQ and VDD on one side and must be larger than or equal to VSSQ and VSS on the other side. In addition, VTT is limited to 0.95V max once power ramp is finished,
 - AND
 - VREF tracks VDDQ/2.
 - •
 - OR
 - •
 - Apply VDD without any slope reversal before or at the same time as VDDQ.
 - Apply VDDQ without any slope reversal before or at the same time as VTT and VREF.
 - The voltage levels on all pins other than VDD, VDDQ, VSS, VSSQ must be less than or equal to VDDQ and VDD on one side and must be larger than or equal to VSSQ and VSS on the other side.
- 2. After /RESET is de-asserted, wait for another 500us until CKE become active. During this time, the DRAM will start internal state initialization; this will be done independently of external clocks.
- 3. Clocks (CK, /CK) need to be started and stabilized for at least 10ns or 5tCK (which is larger) before CKE goes active. Since CKE is a synchronous signal, the corresponding set up time to clock (tIS) must be met. Also a NOP or DESL command must be registered (with tIS set up time to clock) before CKE goes active. Once the CKE registered "high" after Reset, CKE needs to be continuously registered high until the initialization sequence is finished, including expiration of tDLLK and tZQinit.
- 4. The DDR3 SDRAM will keep its on-die termination in high-impedance state during /RESET being asserted at least until CKE being registered high. Therefore, the ODT signal may bein undefined state until tIS before CKE being registered high. After that, the ODT signal must be kept inactive (low) until the power-up and initialization sequence is finished, including expiration of tDLLK and tZQinit.
- 5. After CKE being registered high, wait minimum of tXPR, before issuing the first MRS command to load mode register. (tXPR = max. (tXS ; 5 x tCK))
- 6. Issue MRS command to load MR2 with all application settings. (To issue MRS command for MR2, provide low to BA0 and BA2, high to BA1.)
- 7. Issue MRS command to load MR3 with all application settings. (To issue MRS command for MR3, provide low to BA2, high to BA0 and BA1.)
- 8. Issue MRS command to load MR1 with all application settings and DLL enabled. (To issue DLL Enable command, provide low to A0, high to BA0 and low to BA1 and BA2).
- 9. Issue MRS command to load MRO with all application settings and DLL reset. (To issue DLL reset command, provide high to A8 and low to BA0 to BA2).
- 10. Issue ZQCL command to start ZQ calibration.
- 11. Wait for both tDLLK and tZQinit completed.
- 12. The DDR3 SDRAM is now ready for normal operation.

Reset and Initialization Sequence at Power-on Ramping

8.2.2 <u>Reset Initialization with Stable Power</u>

The following sequence is required for /RESET at no power interruption initialization.

- 1. Assert /RESET below 0.2 x VDD anytime when reset is needed (all other inputs may be undefined). /RESET needs to be maintained for minimum 100ns. CKE is pulled low before /RESET being de-asserted (minimum time 10ns).
- 2. Follow Power-Up Initialization Sequence steps 2 to 11.
- 3. The reset sequence is now completed; DDR3 SDRAM is ready for normal operation.

8.3 Programming the Mode Register

For application flexibility, various functions, features and modes are programmable in four mode registers, provided by the DDR3 SDRAM, as user defined variables, and they must be programmed via a Mode Register Set (MRS) command. As the default values of the Mode Registers (MR#) are not defined, content of mode registers must be fully initialized and/or re-initialized, i.e. written, after Power-up and/or reset for proper operation. Also the contents of the mode registers can be altered by re-executing the MRS command during normal operation. When programming the mode registers, even if the user chooses to modify only a sub-set of the MRS fields, all address fields within the accessed mode register must be redefined when the MRS command is issued. MRS command and DLL Reset does not affect array contents, which means these commands can be executed any time after power-up without affecting the array contents.

The mode register set command cycle time, tMRD is required to complete the write operation to the mode register and is the minimum time required between two MRS commands. The MRS command to non-MRS command delay, tMOD, is required for the DRAM to update the features except DLL reset and is the minimum time required from an MRS command to a non-MRS command excluding NOP and DESL. The mode register contents can be changed using the same command and timing requirements during normal operation as long as the DRAM is in idle state, i.e. all banks are in the precharged state with tRP satisfied, all data bursts are completed and CKE is already high prior to writing into the mode register. The mode registers are divided into various fields depending on the functionality and/or modes.

Mode Register Set Command Cycle Time (tMRD)

tMRD is the minimum time required from an MRS command to the next MRS command. As DLL enable and DLL reset are both MRS commands, tMRD is applicable between MRS to MR1 for DLL enable and MRS to MR0 for DLL reset, and not tMOD.

tMRD Timing

MRS Command to Non-MRS Command Delay (tMOD)

tMOD is the minimum time required from an MRS command to a non-MRS command excluding NOP and DESL. Note that additional restrictions may apply, for example, MRS to MRO for DLL reset followed by read.

tMOD Timing

8.4 DDR3 SDRAM Mode Register 0 [MR0]

The Mode Register MR0 stores the data for controlling various operating modes of DDR3 SDRAM.

It controls burst length, read burst type, /CAS latency, test mode, DLL reset, WR and DLL control for precharge power-down, which include various vendor specific options to make DDR3 SDRAM useful for various applications. The mode register is written by asserting low on /CS, /RAS, /CAS, /WE, BAO, BA1 and BA2, while controlling the states of address pins according to the table below.

Notes:

- 1. BA2 and A13 ~ A14 are reserved for future use and must be programmed to 0 during MRS.
- 2. WR (Write Recovery for auto-precharge) min in clock cycle is calculated by dividing tWR (in ns) by tCK (in ns) and rounding up to the next integer:
 - WR min [cycles] = roundup (tWR [ns] / tCK [ns]).
 - The WR value in the mode register must be programmed to be equal or larger than WR min. The
 programmed WR value is used with tRP to determine tDAL.

MR0 Programming

8.5 DDR3 SDRAM Mode Register 1 [MR1]

The Mode Register MR1 stores the data for enabling or disabling the DLL, output driver strength, RTT_Nom impedance, additive latency, write leveling enable and Qoff. The Mode Register 1 is written by asserting low on /CS, /RAS, /CAS, /WE, high on BA0 and low on BA1, while controlling the states of address pins according to the table below.

Notes:

- 1. BA2, A8, A10 and A13 ~ A14 are reserved for future use (RFU) and must be programmed to 0 during MRS.
- 2. Outputs disabled DQ, DQS, /DQS.
- 3. RZQ = 240 Ohm
- 4. If RTT_Nom is used during writes, only the values RZQ/2, RZQ/4 and RZQ/6 are allowed.
- 5. In write leveling mode (MR1[bit7] = 1) with MR1[bit12] = 1, all RTT_Nom settings are allowed; in write leveling mode (MR1[bit7] = 1) with MR1[bit12] = 0, only RTT_Nom settings of RZQ/2, RZQ/4 and RZQ/6 are allowed

MR1 Programming

8.6 DDR3 SDRAM Mode Register 2 [MR2]

The Mode Register MR2 stores the data for controlling refresh related features, RTT_WR impedance and /CAS write latency (CWL). The Mode Register 2 is written by asserting low on /CS, /RAS, /CAS, /WE, high on BA1 and low on BA0, while controlling the states of address pins according to the table below.

Notes:

- 1. BA2, A8 and A11 to A14 are RFU and must be programmed to 0 during MRS.
- 2. The Rtt_WR value can be applied during writes even when Rtt_Nom is desabled. During write leveling, Dynamic ODT is not available.
- 3. Optional in DDR3 SDRAM: If PASR (Partial Array Self-Refresh) is enabled, data located in areas of the array beyond the specified address range will be lost if self-refresh is entered. Data integrity will be maintained if tREF conditions are met and no self-refresh command is issued.

MR2 Programming

8.7 DDR3 SDRAM Mode Register 3 [MR3]

The Mode Register MR3 controls Multi Purpose Registers (MPR). The Mode Register 3 is written by asserting low on /CS, /RAS, /CAS, /WE, high on BA1 and BA0, while controlling the states of address pins according to the table below.

Notes :

- 1. BA2, A3 to A14 are reserved for future use (RFU) and must be programmed to 0 during MRS.
- 2. The predefined pattern will be used for read synchronization.
- 3. When MPR control is set for normal operation, MR3 A[2]=0, MR3 A[1:0] will be ignored.

MR3 Programming

8.8 Extended Temperature Usage

[Mode Register Description]

| Field | Bits | Description | |
|-------|--|--|--|
| ASR | $MR2(\Delta 6)$ | Auto Self-Refresh (ASR) when enabled, DDR3 SDRAM automatically provides Self-Refresh power management functions for all supported operating temperature values. If not enabled, the SRT bit must be programmed to indicate TC during subsequent Self-Refresh operation 0 = Manual SR Reference (SRT) 1 = ASR enable | |
| SRT | Self-Refresh Temperature (SRT) Range If ASR = 0, the SRT bit must be programmed to indicate TC during subsequent Self-Refresh op SRT MR2 (A7) If ASR = 1, SRT bit must be set to 0b 0 = Normal operating temperature range 1 = Extended (optional) operating temperature range | | |

Partial Array Self-Refresh (PASR)

Optional in DDR3 SDRAM: Users should refer to the DRAM supplier data sheet and/or the DIMM SPD to determine if DDR3 SDRAM devices support the following options or requirements referred to in this material. If PASR (Partial Array Self-Refresh) is enabled, data located in areas of the array beyond the specified address range shown in figure of MR2 programming will be lost if Self-Refresh is entered. Data integrity will be maintained if tREFI conditions are met and no Self-Refresh command is issued.

Auto Self-Refresh Mode - ASR Mode

DDR3 SDRAM provides an Auto Self-Refresh mode (ASR) for application ease. ASR mode is enabled by setting MR2 bit A6 = 1 and MR2 bit A7 = 0. The DRAM will manage self-refresh entry in either the Normal or Extended (optional) Temperature Ranges. In this mode, the DRAM will also manage self-refresh power consumption when the DRAM operating temperature changes, lower at low temperatures and higher at high temperatures.

If the ASR option is not supported by the DRAM, MR2 bit A6 must be set to 0.

If the ASR mode is not enabled (MR2 bit A6 = 0), the SRT bit (MR2 A7) must be manually programmed with the operating temperature range required during self-refresh operation.

Support of the ASR option does not automatically imply support of the Extended Temperature Range.

Self- Refresh Temperature Range - SRT

If ASR = 0, the Self-Refresh Temperature (SRT) Range bit must be programmed to guarantee proper self-refresh operation. If SRT = 0, then the DRAM will set an appropriate refresh rate for self-refresh operation in the Normal Temperature Range. If SRT = 1 then the DRAM will set an appropriate, potentially different, refresh rate to allow self-refresh operation in either the Normal or Extended Temperature Ranges. The value of the SRT bit can effect self-refresh power consumption, please refer to the IDD table for details.

For parts that do not support the Extended Temperature Range, MR2 bit A7 must be set to 0 and the DRAM should not be operated outside the Normal Temperature Range.

[Self-Refresh Mode Summary]

| MR2 A[6] | MR2 A[7] | Self-Refresh operation | Allowed Operating Temperature Range for Self-Refresh Mode |
|-------------|-------------|--|--|
| 0 | 0 | Self-refresh rate appropriate for the Normal Temperature Range | Normal (0 - 85°C) |
| 0 | 1 | Self-refresh rate appropriate for either the Normal or Extended Temperature Ranges. The DRAM must support Extended Temperature Range. The value of the SRT bit can effect self-refresh power consumption, please refer to the IDD table for details. | Normal and Extended (0 - 95°C) |
| 1 | 0 | ASR enabled. Self-Refresh power consumption is temperature dependent | Normal (0 - 85°C) |
| 1 | 0 | ASR enabled. Self-Refresh power consumption is temperature dependent | Normal and Extended (0 - 95°C) |
| 1 | 1 | Illegal | |

Doc. No. DSA3T2GF340CBFF.08 A3T2GF30CBF/A3T2GF40CBF 2Gb DDR3/DDR3L SDRAM

8.9 Refresh Command

The refresh command (REF) is used during normal operation of the DDR3 SDRAMs. This command is non-persistent, so it must be issued each time a refresh is required. The DDR3 SDRAM requires refresh cycles at an average periodic interval of tREFI. When /CS, /RAS and /CAS are held low and /WE high at the rising edge of the clock, the chip enters a refresh cycle. All banks of the SDRAM must be precharged and idle for a minimum of the precharge time tRP(min) before the refresh command can be applied. The refresh addressing is generated by the internal refresh controller. This makes the address bits "Don't Care" during a refresh command. An internal address counter supplies the addresses during the refresh cycle. No control of the external address bus is required once this cycle has started. When the refresh cycle has completed, all banks of the SDRAM will be in the precharged (idle) state. A delay between the refresh command and the next valid command, except NOP or DESL, must be greater than or equal to the minimum refresh cycle time tRFC(min) as shown in the following figure. Note that the tRFC timing parameter depends on memory density.

In general, a refresh command needs to be issued to the DDR3 SDRAM regularly every tREFI interval. To allow for improved efficiency in scheduling and switching between tasks, some flexibility in the absolute refresh interval is provided. A maximum of 8 refresh commands can be postponed during operation of the DDR3 SDRAM, meaning that at no point in time more than a total of 8 refresh commands are allowed to be postponed. In case that 8 refresh commands are postponed in a row, the resulting maximum interval between the surrounding refresh commands is limited to 9 × tREFI. A maximum of 8 additional refresh commands can be issued in advance ("pulled in"), with each one reducing the number of regular refresh commands required later by one. Note that pulling in more than 8 refresh commands in advance does not further reduce the number of regular refresh commands required later, so that the resulting maximum interval between two surrounding refresh commands can be issued within 2 × tREFI. Self-refresh mode may be entered with a maximum of eight refresh commands being postponed. After exiting self-refresh mode with one or more refresh commands postponed, additional refresh commands may be postponed to the extent that the total number of postponed refresh commands (before and after the self-refresh) will never exceed eight. During self-refresh mode, the number of postponed or pulled-in REF commands does not change.

Pulling-in Refresh Commands

8.10 Self-Refresh Operation

The self-refresh command can be used to retain data in the DDR3 SDRAM, even if the rest of the system is powered down. When in the self-refresh mode, the DDR3 SDRAM retains data without external clocking. The DDR3 SDRAM device has a built-in timer to accommodate self-refresh operation. The self-refresh entry (SELF) command is defined by having /CS, /RAS, /CAS and CKE held low with /WE high at the rising edge of the clock.

Before issuing the self-refresh entry command, the DDR3 SDRAM must be idle with all bank precharge state with tRP satisfied. 'Idle state' is defined as all banks are closed (tRP, tDAL, etc. satisfied), no data bursts are in progress, CKE is high, and all timings from previous operations are satisfied (tMRD, tMOD, tRFC, tZQinit, tZQoper, tZQCS, etc.) Also, on-die termination must be turned off before issuing self-refresh entry command, by either registering ODT pin low "ODTL + 0.5tCK" prior to the self-refresh entry command or using MRS to MR1 command. Once the self-refresh entry command is registered, CKE must be held low to keep the device in self-refresh mode. During normal operation (DLL on), MR1 (A0 = 0), the DLL is automatically disabled upon entering self-refresh and is automatically enabled (including a DLL-Reset) upon exiting self-refresh.

When the DDR3 SDRAM has entered self-refresh mode all of the external control signals, except CKE and /RESET, are "don't care". For proper self-refresh operation, all power supply and reference pins (VDD, VDDQ, VSS, VSSQ, VREFCA and VREFDQ) must be at valid levels. VREFDQ supply may be turned OFF and VREFDQ may take any value between VSS and VDD during self-refresh operation, provided that VREFDQ is valid and stable prior to CKE going back high and that first write operation or first write leveling activity may not occur earlier than 512 nCK after exit from self-refresh. The DRAM initiates a minimum of one refresh command internally within tCKESR period once it enters self-refresh mode.

The clock is internally disabled during self-refresh operation to save power. The minimum time that the DDR3 SDRAM must remain in self-refresh mode is tCKESR. The user may change the external clock frequency or halt the external clock tCKSRE cycles after self-refresh entry is registered, however, the clock must be restarted and stable tCKSRX clock cycles before the device can exit self-refresh operation. To protect DRAM internal delay on CKE line to block the input signals, one NOP (or DESL) command is needed after self-refresh entry.

The procedure for exiting self-refresh requires a sequence of events. First, the clock must be stable prior to CKE going back high. Once a self-refresh exit command (SREX, combination of CKE going high and either NOP or DESL on command bus) is registered, a delay of at least tXS must be satisfied before a valid command not requiring a locked DLL can be issued to the device to allow for any internal refresh in progress.

Before a command that requires a locked DLL can be applied, a delay of at least tXSDLL must be satisfied. Depending on the system environment and the amount of time spent in self-refresh, ZQ calibration commands may be required to compensate for the voltage and temperature drift as described in ZQ Calibration section. To issue ZQ calibration commands, applicable timing requirements must be satisfied (See Figure ZQ Calibration).

CKE must remain high for the entire self-refresh exit period tXSDLL for proper operation except for self-refresh reentry. Upon exit from self-refresh, the DDR3 SDRAM can be put back into self-refresh mode after waiting at least tXS period and issuing one refresh command (refresh period of tRFC). NOP or DESL commands must be registered on each positive clock edge during the self-refresh exit interval tXS. ODT must be turned off during tXSDLL.

The use of self-refresh mode introduces the possibility that an internally timed refresh event can be missed when CKE is raised for exit from self-refresh mode. Upon exit from self-refresh, the DDR3 SDRAM requires a minimum of one extra refresh command before it is put back into self-refresh mode.

Notes:

- 1. Only NOP or DESL commands.
- 2. Valid commands not requiring a locked DLL.
- 3. Valid commands requiring a locked DLL.
- 4. One NOP or DESL commands.

Self-Refresh Entry and Exit Timing

8.11 DLL-off Mode
